

```

<!--
12      Develop a PHP program to read the contents of a HTML form
        and display the contents on a browser.

        HTML form file, 12_1_html_form.html
-->
<!--
Two file approach:
    HTML file for the form, to collect user input
        and then pass it to PHP program
    PHP file to accept(read) variables and values passed to it
-->
<!--
    HTML to read user input ----send-to----> PHP to process
                                action = script name/URL
                                PHP
                                |
HTML   ----->
using form input          | form data appended to the action URL
and method = get          | sent as the request body
    = post                |
                                |
                                | using HTTP GET POST PUT
-->

<form method="get" action="12_2_disp_user_input.php">

    Department: <input type="text" name="dept" /> <br />

    Semester:   <input type="number" name="sem" /> <br />

                <input type="submit" value="Submit" />
</form>
<!--
    HTML to read user input ----send-to----> PHP to process
                                |
                                | using HTTP GET POST PUT
                                |
                                | verify the same, on Firefox
                                | Web Developer Tools, F12 , or
                                | Ctrl Shift I , or
                                | ≡ → More tools → Web Developer Tools
                                | and
                                | Network (Network Monitor), or Ctrl Shift E

Based on context, use method="get", or method="post"
When submit button on HTML page is clicked, mentioned action script:
    HTTP request for PHP script is made by browser
If HTML form uses
    method="get"
        then, action script, observe URL, http link script?varname=value
        Web Developer Tools → Network (Network Monitor)
        Network → Click on successful 200 Method GET → Headers tab
        Headers tab right hand side
        form data is part of GET request
    method="post"
        then, variable and value sent as part of request body
        Web Developer Tools → Network (Network Monitor)
        Network → Click on successful 200 Method POST → Request tab
        Request tab right hand side
        Request tab has Form data
        or if Raw toggle button is switched, then, Request payload
-->

```
